

the 1990s, the number of people in the world who are undernourished has increased from 600 million to 800 million (FAO 1996).

There are a number of reasons why the world's population is becoming more undernourished. First, the world's population is growing rapidly, and the number of mouths to feed is increasing. Second, the world's food production is not keeping pace with the growing demand. Third, the world's food distribution is becoming more unequal, with the rich countries consuming more food than the poor countries. Fourth, the world's food quality is declining, with the poor countries consuming less nutritious food than the rich countries. Fifth, the world's food security is becoming more precarious, with the poor countries being more vulnerable to food shortages.

There are a number of ways in which the world's food situation can be improved. First, the world's food production can be increased by using more efficient farming techniques. Second, the world's food distribution can be made more equitable by ensuring that food is available to all people. Third, the world's food quality can be improved by ensuring that food is nutritious. Fourth, the world's food security can be improved by ensuring that food is available at all times.

There are a number of challenges that the world faces in improving its food situation. First, the world's population is growing rapidly, and the number of mouths to feed is increasing. Second, the world's food production is not keeping pace with the growing demand. Third, the world's food distribution is becoming more unequal, with the rich countries consuming more food than the poor countries. Fourth, the world's food quality is declining, with the poor countries consuming less nutritious food than the rich countries. Fifth, the world's food security is becoming more precarious, with the poor countries being more vulnerable to food shortages.
