

the 1990s, the number of people in the world who are undernourished has increased from 250 million to 800 million (FAO 1996). The number of people who are malnourished has increased from 1.2 billion to 1.6 billion (FAO 1996).

There are a number of reasons why the world's population is becoming more malnourished. One of the main reasons is that the world's population is growing rapidly. The world's population is expected to reach 8 billion by the year 2025 (FAO 1996). This means that there will be a need for more food to feed the growing population.

Another reason why the world's population is becoming more malnourished is that the world's food supply is not increasing fast enough to keep up with the growing population. The world's food supply is expected to reach 1.6 billion tonnes by the year 2025 (FAO 1996). This is not enough to feed the growing population.

A third reason why the world's population is becoming more malnourished is that the world's food supply is not distributed evenly. Some countries have a surplus of food, while others have a shortage. This is because of differences in the way that food is produced and distributed in different countries.

There are a number of ways that the world's food supply can be increased. One way is to increase the amount of land that is used for agriculture. Another way is to increase the amount of food that is produced on the same amount of land. This can be done by using better farming techniques and by using more fertilizers and pesticides.

There are also a number of ways that the world's food supply can be distributed more evenly. One way is to reduce the amount of food that is wasted. Another way is to increase the amount of food that is donated to people who are in need. This can be done by governments, by non-governmental organizations, and by individuals.

There are a number of ways that the world's food supply can be made more sustainable. One way is to use less land for agriculture. Another way is to use less water for agriculture. This can be done by using better farming techniques and by using more efficient irrigation systems.

There are a number of ways that the world's food supply can be made more affordable. One way is to reduce the cost of food. Another way is to increase the amount of food that is produced. This can be done by using better farming techniques and by using more fertilizers and pesticides.

There are a number of ways that the world's food supply can be made more secure. One way is to reduce the risk of food shortages. Another way is to increase the amount of food that is produced. This can be done by using better farming techniques and by using more fertilizers and pesticides.
